Springer-Verlag Gmbh Sep 2010, 2010. Taschenbuch. Book Condition: Neu. 0x0x cm. Neuware - Currently a plethora of heterogeneous, standalone or web-enabled applications exist providing various functionalities that could be exploited in innumerable contexts for the development of personalized agent-based solutions for the end user. The integration of these applications in a standard and seamless way to enable content-rich services for the end-user is not generally feasible. The main reason for this is that these applications are by nature heterogeneous, developed for different development platforms, using different software development technologies. In this paper we present a reference architecture and support tools designed to address the problem of seamless integration of heterogeneous software applications through data mining (DM) on web service (WS) data (web service mining) in order to enhance personalization, pervasiveness and efficiency on behalf of agent-based end-user applications. This work presented in this paper is part of a European funded project called OASIS, whose main objective is the implementation of an ontology-driven, open reference architecture, which will enable and facilitate interoperability, seamless connectivity and sharing of content between different services and ontologies in application domains for the elderly and beyond. OASIS promotes new ways to integrate all supported applications into a common environment that enables access to information and content from the existing applications through WS-based software interfaces and content delivery to end-user in a pervasive manner through multi-agent applications. The achievement of this objective forms the main motivation of our work that results in a WS mining framework for the delivery of personalized services to the elderly users through a multi-agent system (MAS). 192 pp. Englisch.
